
Scholarship in Occupational Therapy

In this document, we present the position of the American Occupational Therapy Association (AOTA) on the importance of scholarship to the growth, development, and vitality of the profession, and we describe the range of scholarly activities that will advance the profession. In addition, this document serves to inform both internal and external audiences concerning the expectations for—and the role of—scholarship in occupational therapy practices..

It is important to distinguish between scholarly practice and scholarship. *Scholarly practice* involves using the knowledge base of the profession or discipline in one's practice. As occupational therapy practitioners we, call this scholarly practice *evidence-based practice*. When engaged in scholarly teaching, educators draw on the "knowledge base on teaching and learning" (McKinney, 2007, p. 9) and their discipline or professional knowledge bases. Occupational therapy practitioners engaged in scholarly practice or scholarly teaching are reflective practitioners who assess and discuss their actions in light of the current knowledge base (McKinney, 2007; Schön, 1983). In contrast, *scholarship* or *research* is "a systematic investigation... designed to develop or to contribute to generalizable knowledge" (U.S. Department of Health and Human Services, 2005). Scholarship is made public, subject to review, and part of the discipline or professional knowledge base (Glassick, Huber, & Maeroff, 1997). It allows others to build on it and further advance the field.

Occupational therapy practitioners view scholarship as a vitally important contribution to the profession, the academy, and ultimately to society. Hence, practitioners see that engaging in scholarship is a professional responsibility. Every occupational therapy practitioner should contribute independently or collaboratively to building the evidence base for occupational therapy practice and occupational therapy education (Accreditation Council for Occupational Therapy Education, 2008; AOTA, 2007).

Occupational therapy practitioners are committed to engagement in scholarship that honors societal ethical standards and adheres to the standards of rigor accepted by the scientific community. Occupational therapy scholars value empiricism as the means by which knowledge must emerge, recognizing that through a variety of experimental and naturalistic means one may achieve knowledge and understanding (DePoy & Gitlin, 2005; Kielhofner, 2006). Moreover, they recognize that knowledge is not established in isolation but through interdisciplinary collaboration and intellectual discourse (Yerxa, 1987). As providers of therapeutic and educational services, occupational therapy practitioners are committed to continually developing foundational and theoretical knowledge that underlies practice; understanding the process and outcomes of service; and finally, establishing evidence of efficacious therapy and educational outcomes (Kielhofner, 2006).

The profession recognizes the necessity of a broad range of scholarly endeavors that will serve to describe and interpret the scope of the profession, establish new knowledge, interpret and appropriately apply this knowledge to practice, and engage learners in their development and understanding of the profession. Therefore, we acknowledge the relevance and legitimacy of the variety of scholarly approaches as described by Boyer (1990): the Scholarship of Discovery, the Scholarship of Integration, the Scholarship of Application, and the Scholarship of Teaching. This range of scholarship is particularly relevant considering

the diversity in the field of occupational therapy represented by stakeholders with varying educational backgrounds. The four types of scholarship are discussed in the order Boyer (1990) presented them in *Scholarship Reconsidered: Priorities for the Professoriate*. He did not identify a hierarchy among the four types of scholarship and none is intended in this document.

Scholarship of Discovery

According to Boyer (1990), the *Scholarship of Discovery* is the engagement in activity that leads to the development of “knowledge for its own sake” (p. 17). The Scholarship of Discovery encompasses original research that contributes to expanding the knowledge base of a discipline. It is the type of research that the academic community most easily recognizes and accepts, and as such, is often the expected vehicle for intellectual discourse within the academy. Traditionally, faculty members who are trained to be independent researchers in research universities conduct discovery scholarship. Such scholars are, according to Golde (2006), stewards of the discipline responsible for “*generating* new knowledge and defending knowledge claims against challenges and criticism; of *conserving* the most important ideas and findings that are a legacy of past and current work; and of *transforming* knowledge that has been generated and conserved by teaching well to a variety of audiences, including those outside formal classrooms.”

Clearly, there is a need for scholarship in occupational therapy that expands overall understanding of the engagement in and meaning of human occupation and its role in attaining and maintaining health. Clark (2006) noted that the profession needed a critical mass of the scholarship of discovery to continue to build the theoretical and knowledge base for occupational therapy, to foster intellectual vitality, and to maintain and strengthen the central tenets of the discipline.

Scholarship of Integration

The *Scholarship of Integration* is concerned with making creative connections both within and across disciplines to integrate, synthesize, interpret, and create new perspectives and theories. This form of scholarship is the most similar to the Scholarship of Discovery, but the difference lies in the nature of the research questions. In this form of inquiry, the scholars’ aim is to find the meaning of research findings and interpret the findings in ways that synthesize isolated facts from within and outside of the discipline and integrate them to provide a richer and more thorough understanding of the issues. In light of the complex nature of contemporary issues confronting the individual and society, the profession needs the scholarship of integration, which lies in the intersections of disciplinary boundaries, to generate new knowledge for occupational therapy to better understand and meet societal needs.

Scholarship of Application

Through the Scholarship of Application, practitioners apply the knowledge generated by Scholarship of Discovery or Integration to address real problems at all levels of society. In occupational therapy, an example would be the application of theoretical knowledge to practice interventions or to teaching in the classroom. Another example may be using knowledge about the value of occupations as a health determinant to address health disparities of populations. Some authors, in focusing their efforts on application, have coined the term *Scholarship of Practice* (Braveman, Helfrich, & Fisher, 2001; Kielhofner, 2005), which focuses on program development and occupational therapy intervention. Another dimension of the Scholarship of Application is the *Scholarship of Engagement* (1990), which focuses on an interactive, participatory scholarship with persons and organizations (Barker, 2004; Boyer, 1996). In this form of scholarship, multiple stakeholders, including community members, produce knowledge. Regardless of differing terms, these activities fit best under Boyer’s (1990) scholarship of application.

Scholarship of Teaching and Learning

Boyer (1990) identified a fourth area of scholarship, the *Scholarship of Teaching*. Over time it has been expanded to the *Scholarship of Teaching and Learning*, recognizing the interrelatedness of teaching and learning. The Scholarship of Teaching and Learning implies a “research agenda,” and “involves the systematic study of teaching and/or learning and the public sharing and review of such work through presentations, publications, and performances” (McKinney, 2007, p. 10). Contributions must meet the rigorous standards of all forms of scholarship, be public, and be open to critical review.

Scholarship and Practice Roles

Scholarship must be generated, evaluated, and used to inform the many practice roles of occupational therapy. All occupational therapists and occupational therapy assistants, regardless of their individual practice roles, have the professional responsibility to not only use that evidence to inform their professional decision making but also to generate new evidence through independent or collaborative research, or both. For example, research through the Scholarships of Discovery and of Integration will contribute to the improved understanding of the constructs, processes, and theories (e.g., occupation and its therapeutic use) that provide the foundation for meeting society’s complex occupational needs. At other times, through the Scholarship of Application, practitioners will establish evidence concerning the effectiveness of a specific intervention or the reliability, validity, and utility of an assessment tool and appropriately use the intervention or assessment on the basis of the strength of that evidence. Finally, they may develop and use evidence derived from the Scholarship of Teaching and Learning in client education to support participation in meaningful occupations. Practitioners challenge occupational therapy educators—including academic educators, academic fieldwork educators, and fieldwork educators—to find better ways to prepare diverse students to be competent professionals who advance the profession. Through the Scholarship of Teaching and Learning and the Scholarship of Application, they can empirically determine and apply better instructional methodologies to prepare students to meet the demands of a rapidly changing and increasingly complex health care environment, where consumers expect evidence-based practice and continuous professional development of all practitioners. Finally, administrators can contribute to, and benefit from, evidence produced through the Scholarship of Application when determining how best to meet the needs of clients in a cost-effective manner or how to better mentor or supervise others. Additional examples and benchmarks of scholarship are provided in Appendix A.
