The American Occupational Therapy Association  
Report to the Executive Board

DATE: October 12, 2005

FROM: Shirley Kharasch Behr, Ph.D., FAOTA, OTR/L, Chair  
Associate Professor and Senior Scholar  
Department of Occupational Science & Occupational Therapy  
Doisy College of Health Sciences  
Saint Louis University

Karla Gray, LICSW, OTR/L  
Yakima Valley Memorial Hospital, Yakima WA.  
Editor: AOTA MHSIS Newsletter

Beverly P. Horowitz, PhD, LMSW, OTR/L, BCG Clinical Associate Professor Stony Brook University School of Health Technology & Management

Ann O'Sullivan, OTR/L, LSW  
Family Caregiver Specialist  
Southern Maine Agency on Aging  
Chair: Home and Community Health Special Interest Section, AOTA

Beatriz C. Abreu, PhD., OTR, FAOTA, AOTA Board Liaison  
Director of Occupational Therapy  
Transitional Learning Center at Galveston  
Clinical Professor, Dept. of OT, SAHS-UTMB

Janie B. Scott, MA, OT/L, FAOTA, AOTA Staff Liaison  
Director, Practice Department  
Ethics Officer, AOTA

TO: AOTA Board of Directors

SUBJECT: Request for Board Action

TOPIC: Ad Hoc Workgroup on Families and Caregivers Across the Lifespan
Executive Summary

This summary addresses the process and outcomes of our efforts to “identify occupational therapy issues related to care giving and to consider if we, as a profession, are missing the mark relative to our potential for contribution” (letter from Carolyn Baum: July 7, 2005).

The title of this report is intended to clarify the nature of the population that is the focus of our concern. Caregiving is an anticipated feature of parenting for families with very young and school-aged children, and may extend to adult children as well. Families frequently serve in a caregiving capacity with their extended family members (parents, siblings, grandparents, etc.). The role of caregiver may be filled by non-family members who provide this service as paid employees (the formal support system), or on a voluntary basis (the informal support system). Caregiving may be provided at home, in community settings, in acute care or residential facilities. The complexities of this practice domain require explication of the contexts in which families and caregivers perform their caregiving roles and an understanding of the unique demands associated with various life-cycle stages. Thus, this report is directed towards families and caregivers (both informal and formal) across the lifespan.

The collective expertise and knowledge of our members is reflected in all aspects of the following report. Each individual has advanced practice experience among diverse client populations, including gerontology, mental health, early intervention, developmental disabilities, cognitive and physical disabilities, and represent a broad cross-section of the United States, including the Northeast, Midwest, Mid Atlantic, and New England states.

The success of this “long distance” effort bears testimony to the collegiality of the individuals involved, their commitment to the task at hand, and their ability to use the available technology to gather information, communicate, to review, share, and edit their work. From the beginning, each member took responsibility for completing a specific assignment relative to the overall work scope. Questions and issues were identified and discussed and progress was reported on a regular basis vis-à-vis five scheduled telephone conferences that included all members of the group. Agendas were prepared and followed for each phone conference and the outcomes/minutes were distributed via email to all the members.

Action Items and Relation to Strategic Plan:

The following action items and goals are not listed in order of priority. Rather, they are organized and presented sequentially to provide a cohesive planning framework. The objectives for each goal presented below appear in TABLE 1 (see attached), along with specific mention of their correlation with the goals and objectives of AOTA’S Strategic Plan.
**ACTION ITEMS**

1. **GATHER DATA**
   
   **Goal:** Recognize Families and Caregivers Across the Lifespan as an essential and increasingly significant domain of occupational therapy practice.
   
   **Goal:** Support research to explore the efficacy and cost-effectiveness of OT intervention with families and caregivers at each life-cycle stage.

2. **PACKAGE MATERIALS**
   
   **Goal:** Develop a Family and Caregiver Toolkit that emphasizes occupational therapy’s role with families and caregivers. Materials must reflect cultural sensitivity.
   
   **Goal:** Develop a public relations campaign and ensure that all materials reflect cultural sensitivity and are relevant to the cultures for whom they are intended.

3. **DISSEMINATE DATA**
   
   **Goal:** Develop continuing education opportunities which incorporate the evidence gathered and that emphasize occupational therapy’s role with families and caregivers.
   
   **Goal:** Develop targeted marketing and advertising campaign to include advocacy.
   
   **Goal:** Advocate for legislation and policies that support provision of services to families and caregivers with disabilities and chronic illness, across the lifespan.

4. **EVALUATE OUTCOMES**
   
   **Goal:** Provide fiscal and editorial resources to conduct an analysis of the published outcomes of funded research on the efficacy of occupational therapy practice with families and caregivers of persons with disabilities and chronic illness, across the lifespan.
   
   **Goal:** Assess the effects, over time, to establish Families and Caregivers Across the Lifespan as a significant domain of OT practice.

**Fiscal Implications**

Following consultation with Staff Liaison, Janie Scott, it was determined premature to include fiscal implications at this phase of the process. The major task undertaken thus far was to conduct a preliminary exploration of issues related to families and caregivers across the lifespan. The recommendations that emerge from this report will be forwarded to the AOTA Board of
Directors. The report itself will provide the background materials that the Visioning Group Leaders will consider when they meet early in 2006. If families and caregivers continue to be a priority and recommendations are made to the Representative Assembly, fiscal implications will be determined based on current priorities and recommendations.
Full Report: Families & Caregivers Across the Lifespan

Statement of the Problem

Occupational therapists typically partner with parents, families, and caregivers of individuals with disabilities and chronic illness across the lifespan. That partnership occurs in a variety of treatment settings across all stages of the life-cycle, from early intervention with very young children, to school-based programs for older students, to patient education and discharge planning for adults in healthcare settings, and to working with older adults in their own homes as well as in long-term care settings.

Occupational therapists have made significant contributions to the geriatrics and pediatrics family and caregiving literature (Corcoran & Gitlin, 1992; Crowe, 2002; Dooley & Hinojosa, 2004; Esdaile, 1996; Gitlin, 2003; Gitlin, Corcoran, Winter, Boyce, & Marcus, 1999; Hanft, & Anzalone, 2001; Hasselkus, 1993; VanLeit, & Crowe, 2002).

The occupational therapy literature addresses the challenges of providing family-centered services, and the role of environmental influences on occupational performance for caregivers and care recipients (Clark, Corcoran, & Gitlin, 1995; Gitlin, Corcoran, Leinmillerreckhardt, 1995; Humphry, 1995; Lawlor, Mattingly, 1998; Moyers, 1992; Olson, & Esdaile, 2000; SchultzKrohn, 1997; Segal, 2004).

Yet, despite their recognition as key professionals who promote client function, safety, and community living (Horowitz, 2002a, 2002b; Peterson, Howland, Kielhofner, et al., 1999; Walker, & Howland, 1991), occupational therapists often are not identified as the primary professionals in practice settings. Their multiple contributions (which include providing targeted caregiver education; training and skill-building; psychosocial support; reduction of “excess-disability” among care recipients; reduction of caregiver burden; promotion of safety, health, and well-being for both caregivers and care recipients) often go unrecognized and unappreciated.

Background Information

Families who provide informal caregiving (assisting a family member or friend without being paid to do so) present personal, family, economic, and public health issues. Formal (paid) caregiving generally refers to paid assistance with activities of daily living (ADLs) and instrumental activities of daily living (IADLs). Care recipients may be of any age, and may receive either or both types of care.

Family Caregiving and Adults

The population of the United States, as well as their associated needs, is changing. In 1900, only 4.1% of Americans lived to age 65. In 2020, that number is predicted to be 20.7% (Administration on Aging, 2005). With advances in treatment, people are surviving medical crises that they could not have lived through in previous years, but they may be living with chronic conditions. Today 125,000,000 Americans (45% of the population) have at least one
chronic condition. The number of people with chronic conditions will reach 157,000,000 by 2020 (Partnership for Solutions, 2005).

In the United States, more than 44 million people provide care for a chronically ill, disabled, or aged family member or friend during any given year (NAC &AARP, 2005). The average length of time spent on caregiving for a family member over the age of 50 is about 8 years (MetLife, 1999). The value of the services that US family caregivers provide for “free” is estimated to be $257,000,000,000 per year, twice what is actually spent on homecare and nursing home services (Arno, 2002). In fact, family caregivers provide the overwhelming majority of homecare services in the US, approximately 80% (US Agency for Healthcare Research and Quality, 2000).

Elderly spousal caregivers with a history of chronic illness themselves, who are experiencing caregiving-related stress, have a 63% higher mortality rate than their non-caregiving peers (Schulz and Beach, 1999). The stress of family caregiving for persons with dementia has been shown to impact a person’s immune system for up to three years after their caregiving ends, thus increasing their chances of developing a chronic illness themselves (Glaser and Glaser, 2003). Family caregivers who provide care 36 or more hours weekly are more likely than non-caregivers to experience symptoms of depression or anxiety. For spouses, the rate is six time higher; for those caring for a parent, the rate is twice as high.

Unmet needs of caregivers of older adults (NAC & AARP, 2004) include:

- Finding time for myself (35%)
- Keeping the person I care for safe at home (30%)
- Balancing my work and family responsibilities (29%)
- Managing my emotional and physical stress (29%)
- Easy activities I can do with the person I care for (27%)
- How to talk with doctors (22%)
- Making end-of-life decisions (20%)
- Moving or lifting the person I care for (16%)
- Managing challenging behaviors, such as wandering (14%)
- Choosing an assisted living facility (13%)
- Choosing a home care agency (13%)
- Managing incontinence or toileting problems (11%)

About half of all caregivers assist their loved one with personal care. Yet, less than one in five (18%) say they have received formal training on how to care for this individual (NAC & AARP, 2004). Many of these unmet needs fall within the scope of occupational therapy to resolve, by working with the caregiver, or with the caregiver and care recipient.
Family Caregiving and Children/Young Adults

The 2000 US Census identified more than 5,000,000 people, aged 5 to 20, living with a disability, and an additional 30+ million aged 21 to 64 (US Census Bureau, 2000). As of 1992, 2.2% of children under 3, 5.2% of children 3 to 5, 6.3% of 6 – 14 year olds, and 9.3% of 15 – 17 year olds have conditions that cause limitations in age-appropriate activities (CDC, 1995). In 2002, another survey found 7.1% of children under 18 had activity limitations caused by chronic conditions (CDC, 2005). In the absence of children performing the activities themselves, they are accomplished with the assistance of family or paid caregivers. These limitations include mobility, activities of daily living, and school participation, all within the scope of occupational therapy practice to teach both children and their caregivers the most effective means for task accomplishment.

In working with families of young children with development delays and/or developmental disabilities, occupational therapy services range from evaluation and treatment planning to direct intervention to address deficits in motor skills, language skills, social skills, etc., to working directly with families and with other health care and education professionals in a variety of environments (center based, home based, hospital based, school based). Families often need to play dual roles, acting both as the child’s parent and as their therapist/teacher in order to reinforce therapeutic and educational strategies at home. These dual demands often create stressors for the entire family system.

Assuming a client-centered approach expands the role of occupational therapy in providing direct assistance to families to meet their needs dealing with transition issues, future planning and future employment guidance, and consideration of independent living options.

Paid Caregivers

Estimates vary on how many individuals are in the paid caregiving workforce. The Bureau of Labor Statistics (2003), counted approximately 2.4 million workers in the three direct-care categories it tracks: nursing aides, home health aides and personal assistance workers/aides. Other estimates are as high as three million direct care workers (Seavey, 2005). It should be noted that the ability to count caregivers becomes more blurred, as more programs allow payment to family members for care.

The ongoing increase in numbers of older Americans has been well-documented, particularly for people 85 years old and older. Increasing numbers of people are living longer with chronic illnesses and disabilities, which may require complex care and sophisticated technology. In contrast, families are having fewer children, and the pool of available family caregivers is shrinking. With less help available, the stress on those who do provide care may increase, negatively affecting those individuals’ physical, financial, and emotional health (Seavey, 2005).

The paid caregiving workforce is also facing challenges. High turnover, difficult work, and low compensation all contribute to difficulties hiring quality staff, and this industry is subject to the same demographic influences as the pool of family caregivers.
Strategies have been proposed to increase and sustain the pool of paid caregivers. One theory is that improving pre-employment training and continuing education reduces turnover by giving workers the competence and confidence they need to do the job well (Paraprofessional Healthcare Institute (PHI), 2005). Training, including hand-on skills, safety (worker and client), infection control, communication, and behavior management, is required by the Federal government for basic credentialing for Certified Nursing Assistants (CNA) and Home Health Aides (HHA). There may be a similar local requirement for Personal Care Assistants (PCA), but these vary by state. Ongoing training, according to Federal law, must address weaknesses and provide specialized knowledge needed to care for a particular client or resident population (PHI, 2005). This may be an opportunity for occupational therapy to contribute to the retention of competent paid caregivers, while improving the quality of care provided to clients.

Direct support professionals, those who work with individuals with developmental or intellectual disabilities, provide assistance with ADLs and other personal care and housekeeping needs. They may also help consumers become better integrated into community life. The Federal government has no training requirements for these individuals, although most states require some training (PHI, 2005). The relationship between needed skills and OT expertise is clear, making OT a potential partner in recruitment, retention, and quality care.

A major concern for both paid and unpaid caregivers is that care is not given at the expense of the provider’s health. Understanding not only the therapeutic strategies, but how to provide care in an ergonomically correct manner, can minimize caregiver injury and its secondary effects on the client. Occupational therapists can bring this expertise to the therapeutic situation to benefit both client and caregiver.

**Implications for the Profession**

- Potential for an increased emphasis in occupational therapy preprofessional and clinical education programs on expanding knowledge, skills, and intervention approaches to more effectively meet the growing needs of families and caregivers.

- Potential for creating a heightened interest in AOTA membership among non-members who work with families and caregivers and might find value in the profession’s focusing attention and resources on enhancing occupational therapy’s contribution to this practice area.

- Potential for increased advocacy efforts to enhance the limited funding available for family and caregiver programs.

- Potential for increased recognition of the need to address fall prevention and promote caregiver and client safety across the care continuum.

- Potential for increased awareness of occupational therapy’s role in prevention and utilization of evidence-based approaches from the ergonomics and fall prevention literature.
• Potential for establishing expanded partnerships with community-based organizations that historically provide education and services to families and caregivers (i.e. Alzheimer’s Association).

• Potential for enhanced efforts to institute policy initiatives related to organizational policies and third party reimbursement that address the need to:

  1) Conduct a comprehensive literature review to:

     ▶ Evaluate the ways in which caregiver interventions promote care recipient capabilities, safety and health, reduce caregiver distress and burden.

     ▶ Determine whether these services postpone institutional LTC placement.

     ▶ Evaluate the efficacy of occupational therapy family and caregiver interventions for clients, families and caregivers across the lifespan.

  2) Include wording to recognize families and caregivers as ‘clients” in the Definitions section of the American Occupational Therapy Association Standards of Practice.

  3) Provide students, practitioners, clients, caregivers, and families with tools to support increased occupational therapy educational interventions related to community mobility and safe driving.

Recommendations Considered

The recommendations considered were those that seemed consistent with the steps necessary to accomplish the first, and most important goal--the recognition of Families and Caregivers Across the Lifespan as an essential and increasingly significant domain of occupational therapy practice. The achievement of that goal would suggest that the concerns expressed and the information provided in the problem statement and background information provided in this report would, most likely, have been addressed.

Those recommendations, with accompanying goals and objectives, are presented in TABLE ONE of the Executive Summary.

Resources Needed

We recommend that any final action taken on these recommendations include adequate monetary resources for research and information dissemination. Additionally, it is encouraged that staff time and contributions are tabulated and included with any recommendations that are adopted.
