#1. Don’t provide intervention activities that are non-purposeful (e.g., cones, pegs, shoulder arc, arm bike).

Purposeful activities—tasks that are part of daily routines and hold meaning, relevance, and perceived utility such as personal care, home management, school, and work—are a core premise of occupational therapy. Research shows that using purposeful activity (occupation) in interventions is an intrinsic motivator for patients. Such activities can increase attention, endurance, motor performance, pain tolerance, and engagement, resulting in better patient outcomes. Purposeful activities build on a person’s ability and lead to achievement of personal and functional goals. Conversely, non-purposeful activities do not stimulate interest or motivation, resulting in reduced patient participation and suboptimal outcomes.

4 Ways to Make Your Workplace More Occupation-Friendly

1. **Host an occupation drive.** Make a wish list and share it with staff, asking them to donate their unused household items such as kitchen, housekeeping, or craft supplies.

2. **Hold a monthly OT challenge.** To start incorporating more occupation into your practice, choose a month to focus on purposeful activity. Each week of the month, challenge colleagues to replace a non-purposeful intervention with an occupation-based activity (e.g., Week 1: No arm bike, Week 2: No shoulder arc, etc.).

3. **Take a time out from commonly used non-purposeful activities.** Remove non-purposeful activities from the clinic. Prior to removal, brainstorm with peers on other ways to address the needs of the client that are more purposeful but would achieve the desired outcome (e.g., take all peg boards out of the clinic). Prior to removal, list all the activities you could do that would achieve the same goal of increasing fine motor skills, such as taking strawberries out of a container one at a time and rinsing them in the sink, picking coins out of a purse or cup, opening a lipstick tube, taking the lid off of deodorant, eating finger foods, using the ATM, removing a cell phone from a pocket or purse, dialing a phone number or sending a text).

4. **Use available resources from other areas within the facility.** For example, ask the dietary staff if clients can help dry trays, restock paper items, or have supplies to make simple meals (e.g., sandwiches, fruit salads). Ask the housekeeping department if you can borrow vacuums, brooms, mops, and other cleaning supplies so that a client might use them to clean their own room or their area within a shared room. Ask nursing assistants to allow clients assist with or change their own bedding and put away their own personal items. The maintenance staff may have tools or other items to borrow for clients to engage in mechanical tasks. The administrative staff may have small projects that clients could assist with, such as changing out the announcement boards, making announcements, folding flyers, and posting flyers.

<tbody>
<tr>
<td>To return to completing housekeeping tasks after a recent fall</td>
<td>Uses a front-wheeled walker for short-distance indoor mobility, has antigravity strength in UE, can reach above shoulder level</td>
<td>Fatigues after 2–3 minutes of standing or ambulation, has limited sustained UE strength, has a recent fall history</td>
<td>Washing, drying, and folding laundry; hanging clothes in a closet; making a snack or cup of coffee</td>
<td>An arm bike to increase functional endurance</td>
</tr>
<tr>
<td>To complete grooming after a stroke</td>
<td>Very motivated, can tolerate sitting at a table or sink, can stand with minimal assistance for 1 minute</td>
<td>Decreased hand strength and coordination</td>
<td>Retrieving grooming items from toiletry kit and arranging on a table, combing hair, shaving, reaching to turn water on and off</td>
<td>A peg board to improve fine motor skills</td>
</tr>
<tr>
<td>To complete self-feeding independently after a spinal cord injury</td>
<td>Tenodesis grasp, AROM for shoulder and elbow</td>
<td>Decreased hand strength and coordination; decreased wrist ROM</td>
<td>Using pretzel rods to make chocolate-covered pretzels, brushing teeth with an adaptive brush, opening a variety of containers using adaptive techniques, rolling out cookie or bread dough, doing simple meal prep with adaptive devices</td>
<td>A peg board and therapy putty exercises to increase hand strength and coordination</td>
</tr>
<tr>
<td>To increase standing balance (static and dynamic) for participation in IADLs</td>
<td>Can stand with contact guard assistance for 5 minutes before resting, can walk with minimum assistance with FWW or hemi-walker or cane</td>
<td>Loses balance (can be in any direction based on diagnosis)</td>
<td>Obtaining items from kitchen to prepare a simple meal, gardening (planting, watering, weeding), putting dishes away, retrieving bird feeders and refilling feed</td>
<td>Ball toss, balloon toss, playing cards, puzzles</td>
</tr>
</tbody>
</table>

Note. AROM = active range of motion; AAROM = active assisted range of motion; FWW = front-wheeled walker; IADLs = instrumental activities of daily living; ROM = range of motion; UE = upper extremity.
